摘要: 微生物次级代谢产物结构新颖、活性多样, 一直以来都是药物及其先导化合物的重要来源。但近年来在普通微生物纯培养中发现的新活性物质不断减少, 重复发现逐渐增加; 而微生物共培养因更加接近微生物生长的自然环境, 在药物及其先导物挖掘方面发挥着越来越重要的作用。本文分析了近 5 年来利用真菌 vs 真菌、真菌 vs 细菌共培养挖掘新活性化合物的研究现状, 以及研究中存在的问题。

关键词: 共培养, 真菌, 次级代谢产物

Progress of microbial co-culture in new compound mining

ZHAO Xi XIE Yun-Ying BAI Li-Ping*

Abstract: Microbial secondary metabolites have been an important source of drugs and their leading compounds because of their novel chemical structures and various biological activities. However, in recent years, there is a high frequency of re-discovery and a low frequency of new discovery of active compounds from microbial pure culture. As microbial co-culture is closer to the natural environment of microbial growth, it plays an important role in new compound mining. Here, we review the progress of new compound mining through co-culture from fungi vs fungi and fungi vs bacteria, and the current problems of this field for future research is also mentioned.

Keywords: Co-culture, Fungi, Secondary metabolite

微生物次级代谢产物结构新颖、活性多样, 一直以来都被作为药物及其先导化合物的重要来源。真菌次级代谢产物具有多种生理活性, 如抗菌、抗肿瘤、抗氧化、免疫调节和细胞因子诱导

等, 具有巨大的药物开发价值^[1-2]。但是, 随着研究的不断深入, 研究者在微生物次级代谢产物中发现大量有价值的化合物的同时, 筛选得到的微生物资源的重复率不断上升, 具有新结构新活

性的物质发现几率在逐年下降。据统计,从 1990 年后 FDA 批准的微生物天然产物及其衍生物数量逐年下降,在 2001–2007 这 7 年期间整体下降 30% (图 1),基于上述原因,美国许多大公司甚至宣布放弃微生物来源的天然产物开发^[3]。

针对这一情况,近 20 年来科学家们提出一系列解决办法:如开发特殊环境微生物,在其中寻找结构新颖、活性良好的物质^[4];通过宏基因组方法,利用不可培养微生物中的基因资源,异源表达来获得新活性、新结构的化合物^[5];利用已知化合物的生物合成基因簇,通过基因敲除、异源置换等手段,获得已知化合物的新衍生物^[6];利用合成生物学手段对不同来源基因模块组装,绿色、高效合成药物前体等^[7-8]。以上一系列研究发现了大量新化合物,为微生物天然产物的挖掘提供了前进动力。

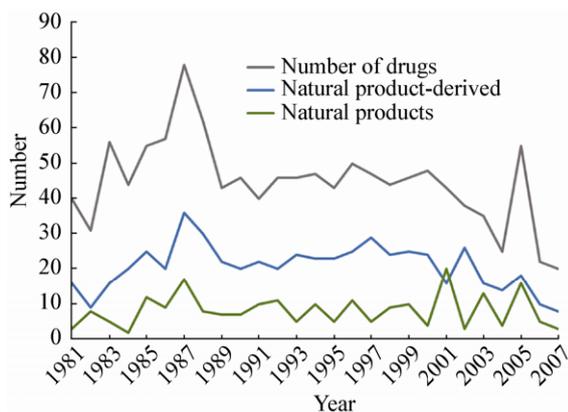

图 1 1981–2007 年 FDA 批准的药物数量^[3]

Figure 1 The number of drugs approved by FDA in 1981–2007^[3]

然而,微生物在自然界是以混合的菌落形式存在的,与单一菌株相比,混合菌落能够完成更为复杂的任务,那些承袭了百年甚至千年的天然传统发酵工艺(天然混合培养),如食品和酒类,现今依然被广泛应用^[9-10]。共培养最初是指在无菌条件下,不同微生物在厌氧或好氧条件下的混合培养^[11]。今天的共培养同已往的天然混合培养有了本质的区别,它着重强调共培养是人们有目的、有意识地利用高通量技术和生物信息平台挖掘新的活性物质或提高产量^[12]。真菌天然产物丰富,是天然药物的重要来源之一,然而随着重复发现越来越多,以及在常规的实验室培养条件下真菌中很多天然产物产量很低或根本不产生,因此通过真菌共培养挖掘新的天然产物正逐渐成为合成生物学的新前沿。

1 真菌 vs 真菌共培养

历史上,人类很久以前就会利用真菌做面包和啤酒了,然而我们对真菌群落却并不了解。自 1929 年弗莱明从真菌中发现青霉素以来,真菌的研究大部分都基于真菌纯培养,从中相继发现了头孢霉素(抗生素)、环孢霉素(免疫抑制剂)、洛伐他汀(降胆固醇药物)、烟曲霉素(血管生长抑制剂)、苔色酸衍生物(抗骨质疏松药物)和麦角生物碱(抗偏头痛和降血压药物)等药物^[13]。近 5 年来利用真菌与真菌共培养技术,结合高效、微量的分离纯化与多靶标(点)评价技术,已经发现了多种新型代谢产物(表 1),且数量呈逐年增加趋势,具有极高的药物开发潜力。

表 1 近 5 年来通过真菌之间共培养发现的活性化合物

Table 1 The number of active substances founded in fungi vs fungi co-culture over the past five years

Co-culture strains (fungi)	Product	Activity	Reference
<i>Talaromyces siamensis</i> & <i>Phomopsis</i> sp.	BE-31405	Anti-fungal/bacteria	[14]
<i>Penicillium citrinum</i> & <i>Beauveria felina</i>	Citrifelins A & B	Anti-bacteria	[15]
<i>Fusarium solani</i> & <i>Talaromyces</i> sp.	Coculnol	Anti-virus	[16]
<i>Phomopsis</i> sp. K38 & <i>Alternaria</i> sp. E33	Cyclopeptide	Anti-fungal	[17]
<i>Alternaria tenuissima</i> & <i>Nigrospora sphaerica</i>	Stemphyperylenol	Anti-fungal	[18]
Two unidentified fungi	Marinamide, methyl marinamide	Anti-tumor	[19]
<i>Alternaria tenuissima</i> & <i>Fusarium culmorum</i> / <i>Fusarium graminearum</i>	Deoxynivalenol, Zearalenone	Anti-bacteria	[20]
Two marine-derived mangrove epiphytic <i>Aspergillus</i> sp.	Aspergicin, Neaspergillic acid	Anti-bacteria	[21]
Two unidentified fungi	Xanthone derivative	Anti-fungal	[22]

真菌共培养产物中发现的新化合物活性多样, 如抗病毒、抗菌、抗肿瘤、免疫调节等, 其中某些化合物还具有多种活性。如 Nonaka 等^[14]将土壤来源的两株真菌 *Phomopsis* sp. FKA-62 和 *Talaromyces siamensis* FKA-61 共培养, 发现 *Phomopsis* sp. FKA-62 能够刺激 *Talaromyces siamensis* FKA-61 产生新化合物 BE-31405 (图 2A), 10 μg 该化合物能够显著抑制 *Phomopsis* sp. FKA-62 (真菌)、*Mucor racemosus* IFO 4581 (真菌)、*Bacillus subtilis* ATCC 6633 (细菌) 和 *Kocuria rhizophila* ATCC 9341 (细菌) 的生长, 而对 *Talaromyces siamensis* FKA-61 无抑制(100 μg), 显示出极好的开发前景; Meng 等^[15]从两株海洋来源真菌 *Penicillium citrinum* MA-197 和 *Beauveria felina* EN-135 共培养产物中分离得到 2 个新的橘霉素衍生物 Citrifelins A 和 B (图 2B), 对包括金黄色酿脓葡萄球菌、大肠杆菌在内的 7 种病原菌有抑制效果; 利用真菌之间的共培养还发现了具有抗病毒活性的青霉素衍生物 Coculnol (图 2C)^[16]、抗肿瘤活性的 Marinamide 和 Methyl marinamide (图 2D)^[19]以及其他一系列具有抗菌活性的新化合物, 极大地丰富了微生物天然产物的来源。

我们课题组前期分离得到一小分子化合物

2460A, 它能显著抑制 HT-29 裸鼠移植瘤的生长^[23]。通过进一步研究发现, 其为两株真菌共培养产生, 并且发酵产物中还有一系列红曲红胺类化合物^[24]。2460A 为其中一个化合物, 通过一系列药理实验证明其可作用于结肠癌肿瘤细胞、结肠癌相关巨噬细胞 IL-6/IL-6R 信号通路及 TNF 信号通路, 抑制细胞 IL-6 及 TNF α 的转录及分泌。

2 真菌 vs 细菌共培养

细菌和真菌通过紧密接触, 可以刺激真菌中某些沉默基因簇转录, 进而诱导新的天然产物生成^[25]。最近的研究证明, 在土壤主要成分草酸盐的降解过程中, 首先需在细菌与真菌的共同作用下使其 pH 发生改变, 这一研究为土壤中细菌与真菌的共同存在提供了现实依据^[26]。这些基础研究的结果极大地刺激了研究者们通过真菌与细菌共培养发现天然产物的热情。在 2011–2015 年间, 大量新结构化合物被鉴定, 除部分活性未定的新结构化合物外, 表 2 中罗列了 5 年期间通过真菌与细菌共培养发现的新化合物, 这些化合物涵盖抗菌、抗肿瘤及抗寄生虫等各个方面, 显示出通过真菌与细菌共培养挖掘结构新颖、活性良好的天然产物的巨大潜力。

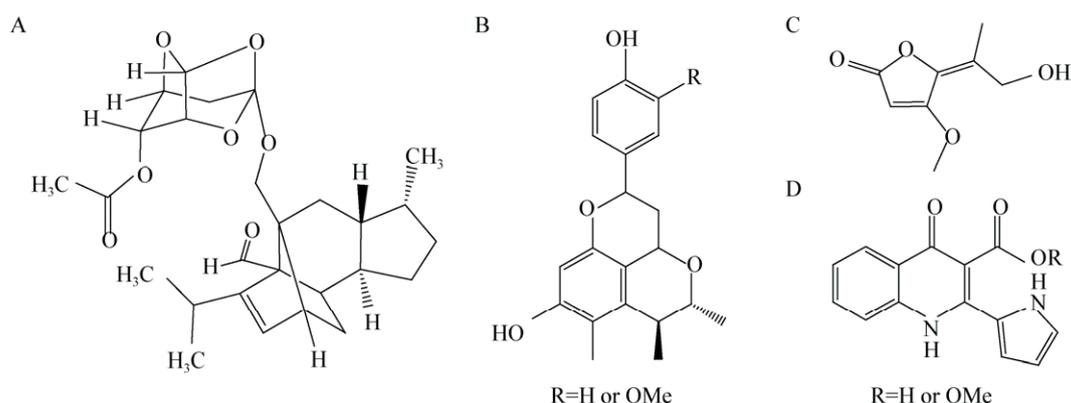

图 2 真菌共培养发现的新化合物结构

Figure 2 Structure of new compounds founded in fungi vs fungi co-culture products

Note: A: BE-31405; B: Citrifelins A and B; C: Coculnol; D: Marinamide and methyl marinamide.

表 2 近 5 年来通过真菌与细菌之间共培养发现的活性化合物
Table 2 The number of active substances founded in bacteria vs fungi co-culture over the past five years

Co-culture strains (fungi & bacteria)	Product	Activity	Reference
<i>Fusarium pallidroseum</i> & <i>Saccharopolyspora erythraea</i>	N-demethylphiosetin pallidoroletin A & B	Anti-tumor	[27]
<i>Rhizopus microsporus</i> & <i>Burkholderia gladiol</i>	iso-enacyloxin IIIa	Anti-fungal/bacteria	[28]
<i>Aspergillus fumigatus</i> & <i>Streptomyces bullii</i>	1-10	Anti-parasitic	[29]
<i>Fusarium tricinctum</i> & <i>Bacillus subtilis</i>	1-3 (Figure 3) Enniatin A1	Anti-bacteria	[30]
<i>Aspergillus fumigatus</i> & <i>Sphingomonas</i> sp.	Glionitrin B	Anti-tumor	[31]
<i>Aspergillus fumigatus</i> & <i>Streptomyces peucetius</i>	N,N'-((1Z,3Z)-1,4-bis(4-methoxyphenyl) buta-1,3-diene-2,3-diyl) diformamide	Anti-tumor	[32]

Rateb 等^[29]通过烟曲霉菌(*Aspergillus fumigatus*)和链霉菌(*Streptomyces bullii*)共培养,发现产生了 10 个这两株菌单独无法产生的化合物,化合物分别为 1: Ergosterol; 2: Brevianamide F; 3: Spirotryprostatin A; 4: 6-Methoxy spirotryprostatin B; 5 和 6: Fumitremorgin C 及其衍生物; 7: Fumitremorgin B; 8: Verruculogen; 9 和 10: 11-O-methylpseurotin A 及其异构体,其中化合物 6、7、8 具有显著的抗寄生虫活性及细胞毒作用; Ola 等^[30]通过三线镰孢(*Fusarium tricinctum*)和枯草芽孢

杆菌(*Bacillus subtilis*)共培养,发现 3 个新结构化合物 Macrocarpon C、N-(carboxymethyl)- anthranilic acid 和 Citreoisocoumarinol (图 3),而且具有抗菌活性的恩镰孢菌素 A1 (Enniatin A1)产量提高 78 倍; Zuck 等^[32]通过烟曲霉菌 (*Aspergillus fumigatus*)和链霉菌 (*Streptomyces peucetius*)共培养,发现两个全新结构的化合物 Fumiformamide 和 N,N'-((1Z,3Z)-1,4-bis(4-methoxyphenyl) buta-1,3-diene-2,3-diyl) diformamide,后一个化合物对多株肿瘤细胞的 IC₅₀ 都在 nmol/L 水平,显示出良好的应用前景。

Figure 3 Structure of new compounds founded in *Fusarium tricinctum* vs *Bacillus subtilis* co-culture products

Note: 1: Macrocarpon C; 2: N-(carboxymethyl)-anthranilic acid; 3: Citreoisocoumarinol.

3 问题与挑战

相较于纯培养微生物的基因突变或表观遗传修饰等手段, 不同微生物共培养模拟自然生态驱动新天然产物生成, 在新型天然产物挖掘方面发挥越来越重要的作用, 但大部分通过共培养产生的新型天然产物生成机制并不明确。Nützmann 等^[33]研究发现, 模式真菌构巢曲霉(*Aspergillus nidulans*)的组蛋白乙酰化可被 *Streptomyces rapamycinicus* 乙酰基转移酶调节, 乙酰化水平增高, 激活某些沉默基因簇, 导致新型次级代谢产物的生成。但是在真菌与真菌之间是否也有类似机制存在未见报道, 其他表观遗传修饰如甲基化修饰等是否在不同菌株共培养中发挥作用也不明确; 此外, 在菌株共培养中还存在一种交互饲喂现象, 即两株菌之间利用各自代谢产物形成新化合物^[34]; 这些不同菌株之间复杂的作用机制给共培养过程中新型天然产物生物合成机制的研究带来了新的挑战, 而这些难题的攻克, 对于研究者们利用已有的微生物基因组信息进行有目的的共培养来挖掘新型天然产物, 将会起到极大的推动作用。
